

“Rotaxanes, catenanes and macrocycles: Using the supramolecular toolbox for the design of novel catalysts”

Prof. Dr. Jochen Niemeyer

Faculty of Chemistry, Organic Chemistry, University Duisburg-Essen

The development of chiral Brønsted-acids, such as 1,1'-binaphthyl-phosphoric acids, has enabled a plethora of highly useful stereoselective organocatalytic transformations. Our group has developed chiral [2]rotaxanes, [2]catenanes and non-interlocked macrocycles based on 1,1'-binaphthyl-phosphoric acids. These were successfully applied as catalysts for various transformations, such as enantioselective transfer-hydrogenations, Michael-additions and fluorinations. In our research, we are investigating how the special nature of the mechanical bond influences the application in catalysis. In this context, we develop novel methods for the synthesis of the desired interlocked catalysts, we investigate the special nature of bifunctional catalysts and we try to approach catalyst structures with mechanical chirality.

Der Vortrag findet am **Di., 16.06.2026, 16:15 Uhr** im CellNanOs statt:
Raum 38/201, Barbarastr. 11, 49076 Osnabrück

Besucher sind herzlich willkommen!

Der Ortsverbandsvorsitzende:

Prof. Dr. Andreas Hennig, Chemie Osnabrück, Universität Osnabrück
